Ahmet Türk - 20166543

Nenette Kanahu Karumb - 22121068

Onur Furkan Nar - 22319232

[Student Name 5] - [Student ID]

Date of Submission: 17/03/2026

1. INTRODUCTION

1.1. Project Background

In many educational institutions, instructors still manage student grades using spreadsheets or manual records. This approach can lead to errors, a lack of transparency, and difficulties in tracking students' academic performance. With the increasing use of digital systems in education, the need for an efficient and centralized platform for managing and monitoring student grades is also growing.

1.2. Problem Statement

There is no centralized, user-friendly system that allows instructors to efficiently record, update, and calculate student grades, and enables students to easily view their academic performance. As a result, grade management becomes time-consuming for instructors, and students may not have timely access to course results.

1.3. Project Aim

The aim of this project is to develop a web-based Student Grading System that allows instructors to record and manage student grades, while enabling students to securely log in and view their grades and course performance.

2. PROPOSED SOLUTION

2.1. Description of the System

The proposed system is a web-based application designed to simplify grade management for both instructors and students. The system will provide two separate interfaces: one for instructors and one for students. Instructors will be able to log in, add students, record grades for assignments, quizzes, and exams, and automatically calculate final grades. Students will be able to securely log into their accounts and view their grades, course performance, and feedback from instructors. The system will ensure the accuracy, transparency, and accessibility of student academic records.

2.2. Key Features (High-Level)

- Feature 1: Secure login system for students and instructors
- Feature 2: Instructors can enter and update grades
- Feature 3: The system calculates averages and final grades
- Feature 4: Students can view their grades and performance
- Feature 5: Instructors can manage courses and enrolled students
- Feature 6: Students can track their overall course performance

3. STAKEHOLDERS AND TARGET USERS

3.1. Primary Users

- **Instructors:** Need to efficiently record, update, and manage student grades for their courses.
- **Students:** Need to access their grades and monitor their academic performance.

3.2. Secondary Stakeholders

- **System Administrator:** Responsible for managing system access, user accounts, and maintenance.
- **University Administration:** May use the system for monitoring course performance and academic reporting.

4. REQUIREMENT HIGHLIGHTS

ID	Requirement Description	Priority (High/Med/Low)
FR-01	The system shall allow instructors and students to log in securely.	High
FR-02	The system shall allow instructors to add and manage student records.	High
FR-03	The system shall allow instructors to enter and update grades	High
FR-04	The system shall automatically calculate final grades based on entered scores.	High
FR-05	The system shall allow students to view their grades and overall course performance.	High
FR-06	The system shall display grade summaries and statistics.	Medium
FR-07	The system shall allow instructors to create and manage courses.	High
FR-08	The system shall allow students to view their course history and previous grades.	High

5. TECHNOLOGY STACK

Layer	Technology Choice	Justification
Frontend (UI)	HTML, CSS, JavaScript	Provides an interactive and user-friendly interface
Backend (Logic)	Node.js	Efficient server-side logic and easy integration with frontend
Database	MySQL	Reliable relational database suitable for structured student data
Version Control	Git / GitHub	Enables collaboration and version tracking
Open Source Libraries	Bootstrap, Chart.js	To speed up development.

6. PROJECT PLAN AND TIMELINE

6.1. Task Breakdown & Gantt Chart

Phase	Week	Activities	Deliverable
Phase 1	Week 1-2	Requirements Elicitation (interviews, surveys)	SRS Draft
Phase 2	Week 3	UML Modeling & Design	Complete UML Diagrams
Phase 3	Week 4–5	System Design (Architecture + Database)	Design Documents
Phase 4	Week 4–5	UI/UX Design	UI Prototypes
Phase 5	Week 6-7	Implementation (Frontend & Backend)	Working Prototype
Phase 6	Week 8	Testing (Unit & Integration)	Tested System
Phase 7	Week 9	Bug Fixing	Improved System
Phase 8	Week 10	Deployment	Final System
Ongoing	Week 3–10	Documentation & Reporting	Final Report

6.2. Gantt Chart

6.3. Team Responsibilities

Team Member	Primary Responsibility
Beste Karasu	Responsible for requirements analysis, use case modelling and documentation. Contributed to defining system requirements, preparing diagrams, and organizing the project report.
Nenette Kanahu Karumb	Responsible for system design, including class diagrams and database design. Also contributed to UI/UX design and system modelling.
Onur Furkan Nar	Responsible for frontend development and user interface implementation. Designed interactive components and ensured user-friendly design.
Ahmet Türk	Responsible for backend development, system logic, and testing. Implemented core functionalities and handled system testing and debugging.

7. CONCLUSION

The Student Grade Management System will provide a simple and effective platform for managing student grades in an organized and transparent manner. By automating grade calculations and providing easy access to academic results, the system will increase efficiency for instructors and enhance the learning experience for students. Furthermore, this project will offer the development team the opportunity to apply software engineering principles such as system analysis, design, implementation, and testing in a real-world application.
